

ABSTRACT

A support salt for a cell comprising a compound represented by the following formula (I) or (II):

(in the formulae (I) and (II),  $\text{A}^1$  is independently  $\text{NRLi}$  or  $\text{F}$ , and at least one of  $\text{A}^1$ s is  $\text{NRLi}$ , and  $\text{R}$  is a monovalent substituent) has an effect of suppressing combustion, and a non-aqueous electrolyte cell and a polymer cell using such a support salt considerably reduce the risk of ignition-fire and are high in the safety.
